COMMERCIALIZATION & PRODUCT STRATEGY REPORT

INTENTLOCK: Product Identity, Value Proposition & Enterprise Pricing Strategy

Author: Divy Bhanushali • Target Audience: Investors, Evaluators, Enterprise Clients

1. What Actually is IntentLock?

INTENTLOCK is an out-of-band, code-level Security Middleware and Developer SDK engineered to solve the single largest barrier to enterprise AI adoption: the unreliability and exploitability of autonomous Large Language Model tool execution.

In plain English, IntentLock acts as a deterministic firewall and Zero-Trust Identity & Access Management (IAM) layer specifically built for AI agents. When an AI bot attempts to read a file, query a database, send an email, or execute a wire transfer, IntentLock intercepts the function call and evaluates it against mathematically verifiable policy rules before any real-world code can run. The AI is never trusted to police itself.

2. How It Helps Organizations (Value Proposition & ROI)

Stakeholder	Core Vulnerability / Risk	IntentLock Business Value
CISO	Prompt injection leaks customer PII or API credentials, causing massive regulatory fines.	Zero-Trust boundary blocks path traversal, unauthorized domains, and credential leaks.
CTO	Teams waste months building custom security checks for every tool.	SDK wraps LangChain & MCP tools in 3 lines of code with instant protection.
Compliance	Violating EU AI Act, SOC2, or HIPAA due to unauditable AI actions.	Tamper-evident audit trail with SHA-256 action hashes and automatic secret redaction.
FinTech Leads	Support agent erroneously issues excessive customer refunds.	Single-use HMAC-SHA256 human approvals halt high-risk transactions until human sign-off.

3. Target Customer Segments & Market Opportunities

1. FinTech & E-Commerce: High urgency; AI agents handling refunds and balance queries can be drained by prompt injections.

2. Enterprise B2B SaaS: Software vendors adding AI Co-Pilots need SOC2 compliance and IAM boundaries to sell to corporate buyers.

3. Healthcare: Telehealth platforms automating clinical notes must adhere to strict HIPAA data exfiltration rules.

4. Enterprise DevOps: Internal bots executing SQL or cloud commands are guarded against destructive operations.

4. Commercial Pricing Models (Subscription vs. License)

Channel A: Developer SaaS Cloud Subscription (Monthly / Annual Recurring)

Tier	Pricing	Interception Limits	Key Features
Developer	$0 / mo	Up to 25,000 / mo	Open-source Python SDK, local policy engine, community support.
Team	$149 / mo	Up to 500,000 / mo	Hosted Security Dashboard, email approval alerts, 30-day audit log.
Business	$499 / mo	Up to 2,500,000 / mo	Slack/Teams triage, 90-day immutable logs, LangChain & MCP proxies.
Enterprise	$1,500 – $3,500 / mo	>10,000,000 / mo	Dedicated cluster, 99.99% SLA, SOC2 exports, priority support.

Channel B: Self-Hosted Enterprise License (Air-Gapped & Banks)

• **Per-Agent Node License:** $1,800 to $3,600 / year per active agent in customer VPC.

• **Enterprise Site License:** $25,000 to $65,000 / year for unlimited agents, Kubernetes Helm charts, and custom policy rules.

5. Go-To-Market Strategy

1. Open-Core: Open-source SDK drives developer adoption; hosted dashboard & team approvals drive monetization.

2. Framework Ecosystems: Certified listing on LangChain and Anthropic MCP directories.

3. Agency Partnerships: 20% recurring margin for software agencies embedding IntentLock into client AI deliverables.
